QR Code 3D Menu App for Restaurants, Cafes, and Hotels

Idea Summary

Build a QR code menu system for restaurants, cafes, and hotels. Each business gets its own digital menu. When a customer scans the QR code, the menu opens on their phone and shows food items in 3D or AR on the table. Customers can swipe between foods, view details, and better understand what they are ordering before they buy.

Problem

Many restaurants still use static paper menus or simple PDF menus. Customers often cannot clearly imagine the size, look, or ingredients of a dish. This can reduce confidence, slow ordering, and create disappointment when the food arrives different from what the customer expected.

Solution

Create a web-based QR menu platform where each restaurant can upload menu items, prices, descriptions, photos, and 3D models. Customers scan the table QR code, open the menu in a browser, and preview selected dishes in 3D on their table. The experience should be simple, fast, and not require installing an app.

How We Can Build It

Start with a web app for restaurant admins to create menus and generate QR codes. Build a customer menu page with categories, food details, and swipe navigation. Add 3D viewing using web-based 3D technology, then improve into AR table placement for supported phones. For the first MVP, use a few sample 3D food models and test with one restaurant or cafe.

MVP Features

- Restaurant profile and menu management.

- QR code generation for each restaurant or table.

- Customer menu page with food images, price, ingredients, and descriptions.

- 3D food preview with swipe to change items.

- Simple admin dashboard for updating menu content.

Potential Customers

Restaurants, cafes, hotels, lounges, and tourism-focused food businesses that want a modern menu experience and better customer engagement.
