Payment Verification App

Idea Summary

Build an app that helps businesses verify whether a payment has really gone through or not. The goal is to reduce fake payment screenshots, manual checking, and confusion during sales or service delivery.

Small Description

For now, this idea can stay simple. The app could connect with supported payment providers, bank notification systems, or transaction references to confirm payment status. A seller or staff member enters or scans a payment reference, and the system returns whether the payment is successful, pending, failed, or unknown.

Possible First Version

A basic dashboard where staff can enter transaction reference numbers, customer phone numbers, or receipt IDs. The system checks available records and shows the result clearly. More details can be added later after deciding which payment providers or banks to support first.
