qbirr

Features:

- Broad Provider Support: Supports CBE, Telebirr, Awash, Dashen, M-Pesa, Bank of Abyssinia, and eBirr (Coopay, KAAFI, Nib, Wegagen, Ahadu).
- Verification: You provide the transaction reference, expected amount, and your own name/account number, and the API returns a simple "verified: true" if the payment matches all criteria.
- Built-in Security: Comes with features to prevent common fraud, like duplicate reference detection and receiver-name matching to ensure the money went to the right account.
- Developer Friendly: Provides official SDKs for Node.js, Python, PHP, and Go to make integration seamless.

Camera Verifier Approach:

1. Extract the Reference: Using an OCR library on the receipt photo, you specifically look for the transaction reference number (e.g., "FT23001234ABC").
2. Identify the Bank: You also need to capture the bank name (e.g., "CBE", "Telebirr") and the receiver's name or account number. This might be done by scanning for keywords.
3. Call the API: Send a `POST` request to `https://verify.qbirr.com/api/v1/verify` with the extracted data: `{ "provider": "cbe", "ref": "FT23001234ABC", "amount": 500, "receiver_name": "YOUR FULL NAME", "receiver_account": "1000017692643" }`.
4. Interpret the Result: The API will instantly return a simple `{"verified": true}` or `false`, telling you if the payment is legitimate.

Pricing:

- Free: 50 verifications per month, forever.
- Starter: 500 ETB per month for 1,000 verifications.
- Pro: 2,000 ETB per month for 10,000 verifications.
- Scale: 8,000 ETB per month for 100,000 verifications.

v.odit.et

Features:

- Single Input: You provide a full receipt URL, and the API returns the parsed data in JSON format.
- Good for QR Codes: The primary input is a URL, making it very suitable for scanning QR codes that contain the full link to a receipt.
- Provider Support: Supports Telebirr, CBE, Zemen, BoA, and Awash.

Camera Verifier Approach:

1. Scan the QR Code: The camera directly scans the QR code on the receipt, which contains the full verification URL (e.g., `https://mbreciept.cbe.com.et/ABC123`).
2. Call the API: Send a `POST` request to `https://v.odit.et/api/verify` with the scanned URL: `{ "receipt_url": "YOUR_SCANNED_URL" }`.
3. Interpret the Result: The API will respond immediately with the raw receipt data in JSON format, which you can then parse in your app.

Pricing:

- No pricing atm, just a limit is applied to the calls

verify.et

Feature s:

- Broad Provider Support: Supports 7 major Ethiopian banks and wallets: CBE, Telebirr, Awash, Dashen, M-Pesa, Bank of Abyssinia, and eBirr (Coopay, KAAFI, Nib, Wegagen, Ahadu).
- "Smart" Verification: You provide the transaction reference, expected amount, and your own name/account number, and the API returns a simple "verified: true" if the payment matches all criteria.
- Built-in Security: Comes with features to prevent common fraud, like duplicate reference detection and receiver-name matching to ensure the money went to the right account.
- Developer Friendly: Provides official SDKs for Node.js, Python, PHP, and Go to make integration seamless.

Camera Verifier Approach:
